INNER CIRCLE

Bug Report, Screenshot Evidence & Action Plan

Prepared: 19 October 2026 **Platform:** Web prototype (mobile and desktop)

Purpose

This document separates each reported issue into three clearly defined parts: **Evidence** (what is visible in the supplied screenshot), **Issue** (what is wrong or needs verification), and **Action to be taken** (the specific implementation or testing task). Screenshots are included in the evidence section for each item.

Issue summary

ID / Area	Evidence	Action to be taken	Priority
IC-01 Match-three game	Board shows Score 0, Moves 7 and coloured tiles.	Run functional tests for tile selection, adjacent swaps, match clearing, refill, scoring, move count and New game reset.	High
IC-02 AI Companion	Simulated sentiment analysis card is visible in chat.	Remove from normal chat view or place behind a clearly labelled demo/developer toggle.	Medium
IC-03 Support options	Tele-MANAS, KIRAN and Emergency services cards are shown.	Remove Tele-MANAS and KIRAN from this prototype screen as requested; add verified DSU Psychiatry contact and nearby hospital/ambulance option.	High
IC-04 Safety popup	Popup includes “I’m safe for now — continue” and “Department contact”.	Remove the continue action/wording; make Department contact open the department contact page or modal.	High
IC-05 Department contact	Department contact button appears to be a dummy button.	Add demo clinician profiles with qualifications, experience, support areas, availability and a working appointment-scheduling flow.	High
IC-06 Profile	Profile says details are read-only.	Make appropriate profile fields editable and add Save/Cancel, validation and saved-state feedback.	Medium

Safety and release requirements

• Keep a clear route to urgent support; do not remove emergency access entirely. Verify all real phone numbers and local services before release. • Any placeholder clinician details must be fictional and visibly marked “Demo profile — not a real clinician”. • An appointment must not be described as booked unless the system confirms it. • A screenshot documents visible UI only; functional status must be confirmed by testing.

IC-01 — Match-three mini-game

Evidence from screenshot

The screenshot shows a 6×6 coloured tile board with Score 0, Moves 7, New game and Back to activities.

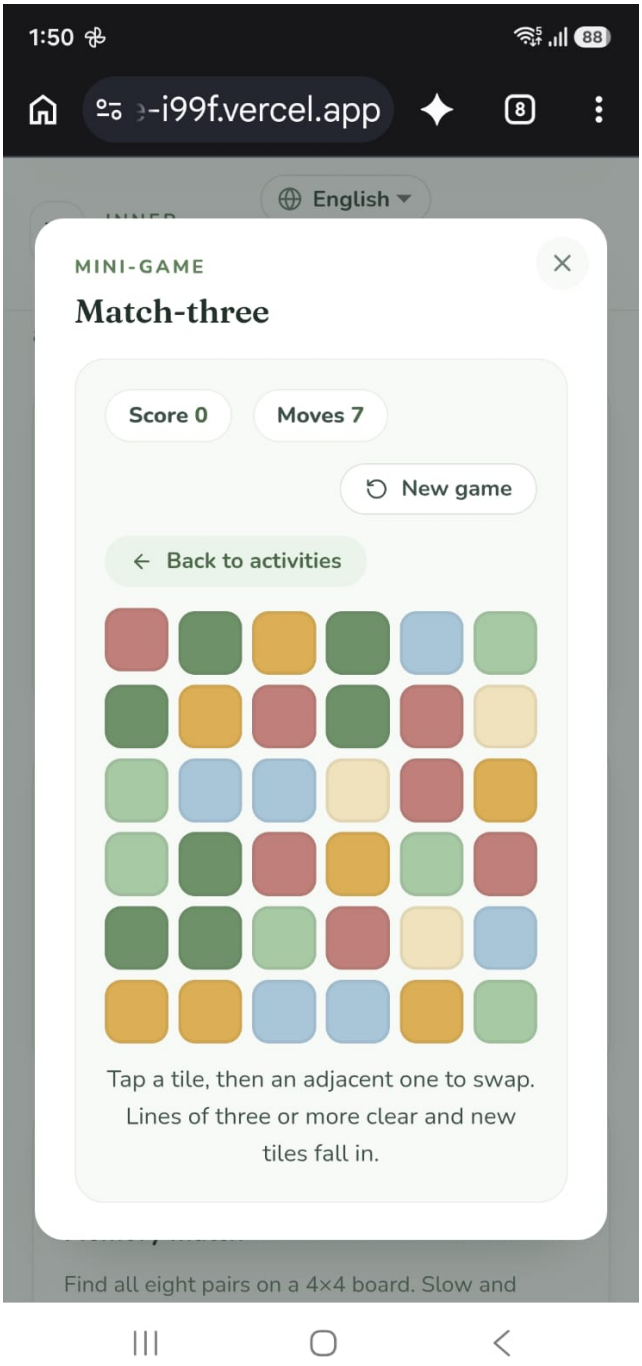

Issue / observation

The screenshot alone cannot confirm whether the game interactions work correctly.

Action to be taken

Test: (1) tap a tile, then an adjacent tile; (2) confirm non-adjacent swaps are rejected; (3) confirm lines of three or more clear; (4) confirm tiles fall and new tiles appear; (5) confirm score and moves update correctly; (6) confirm New game resets board, score and moves; (7) confirm Back to activities returns to the activities page.

Screenshot evidence

IC-02 — AI Companion — sentiment analysis panel

Evidence from screenshot

The screenshot shows a “Simulated sentiment analysis” card with “Last 5 messages read as Negative” and a “DEMO” label.

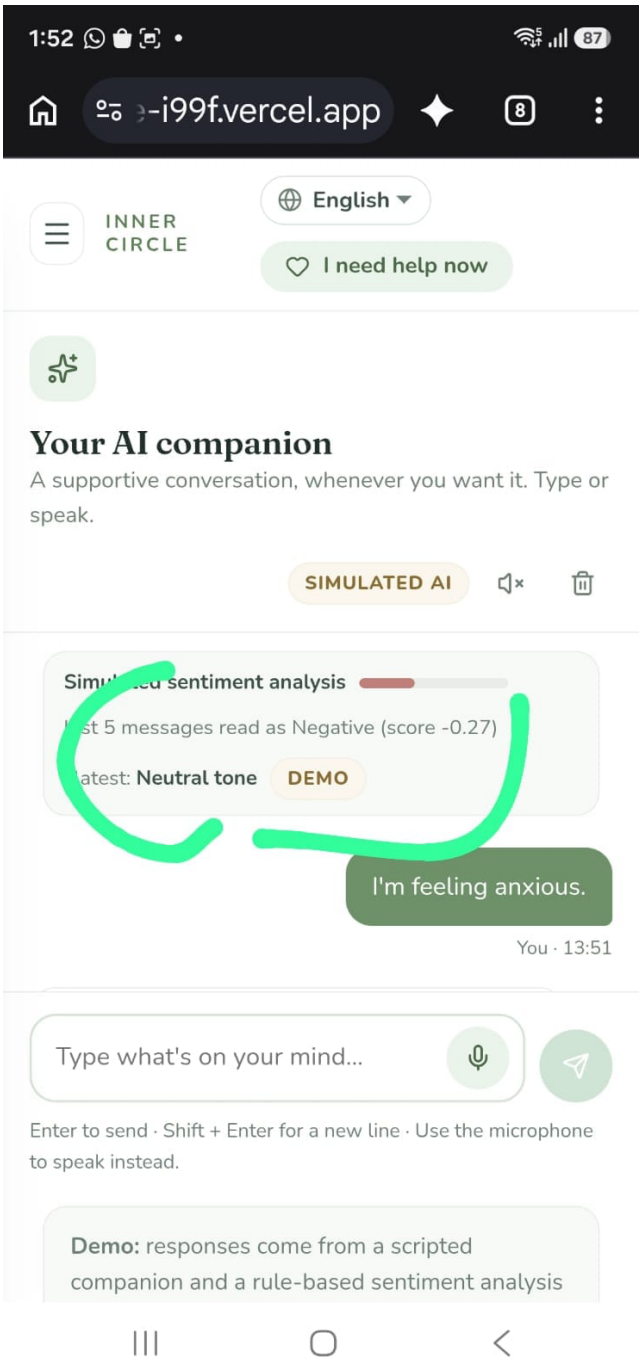

Issue / observation

The analysis panel is visibly prominent in the normal conversation view and may confuse users or distract from the chat.

Action to be taken

Remove the panel from the standard user-facing chat view. If needed for project evaluation, move it behind an optional developer/demo toggle and label the output as simulated. Do not present rule-based demo sentiment as a clinical assessment.

Screenshot evidence

IC-03 — Urgent support options

Evidence from screenshot

The screenshot lists Tele-MANAS, KIRAN helpline and Emergency services (112).

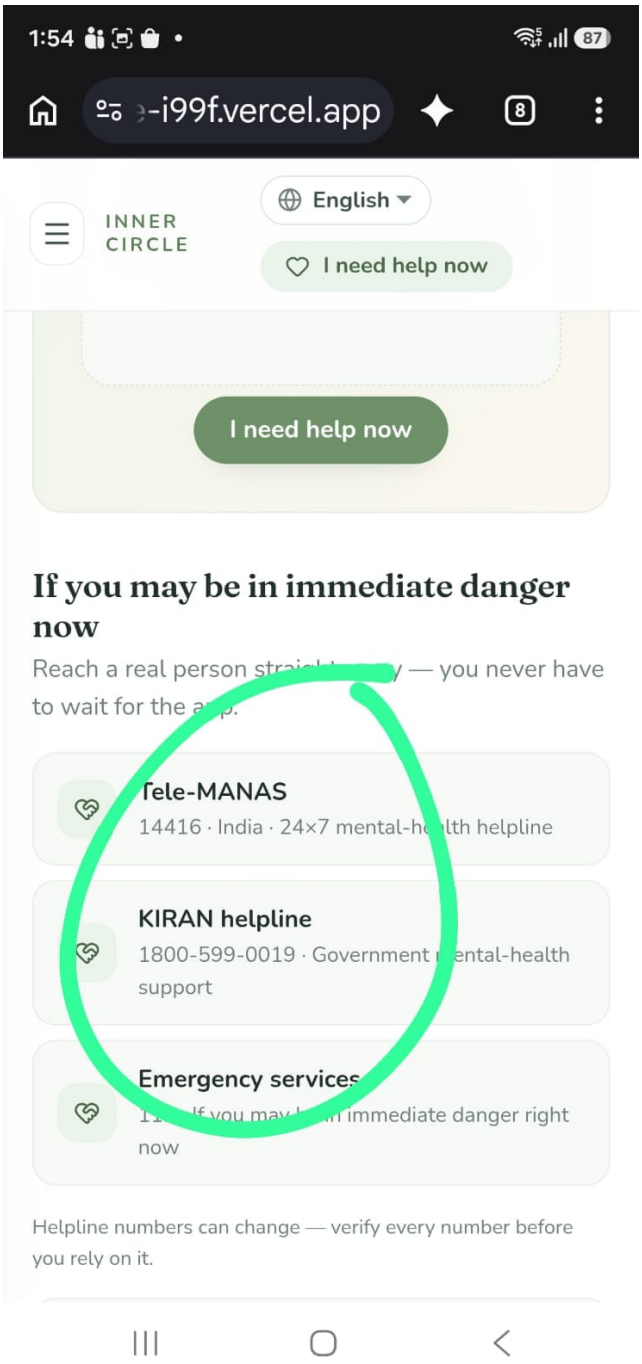

Issue / observation

The requested prototype should not show the Tele-MANAS and KIRAN cards. Department and nearby emergency contacts need to be presented clearly.

Action to be taken

Remove the Tele-MANAS and KIRAN cards from this prototype screen. Add a DSU Department of Psychiatry contact card and a nearby hospital/ambulance service card. Verify the department contact, hospital, ambulance details and phone numbers with the university/local providers before launch. Keep a clear emergency-support route.

Screenshot evidence

IC-04 — Safety popup — continue action

Evidence from screenshot

The screenshot shows a support dialog with “I’m safe for now — continue” and “Department contact”. The desktop screenshot shows the same dialog.

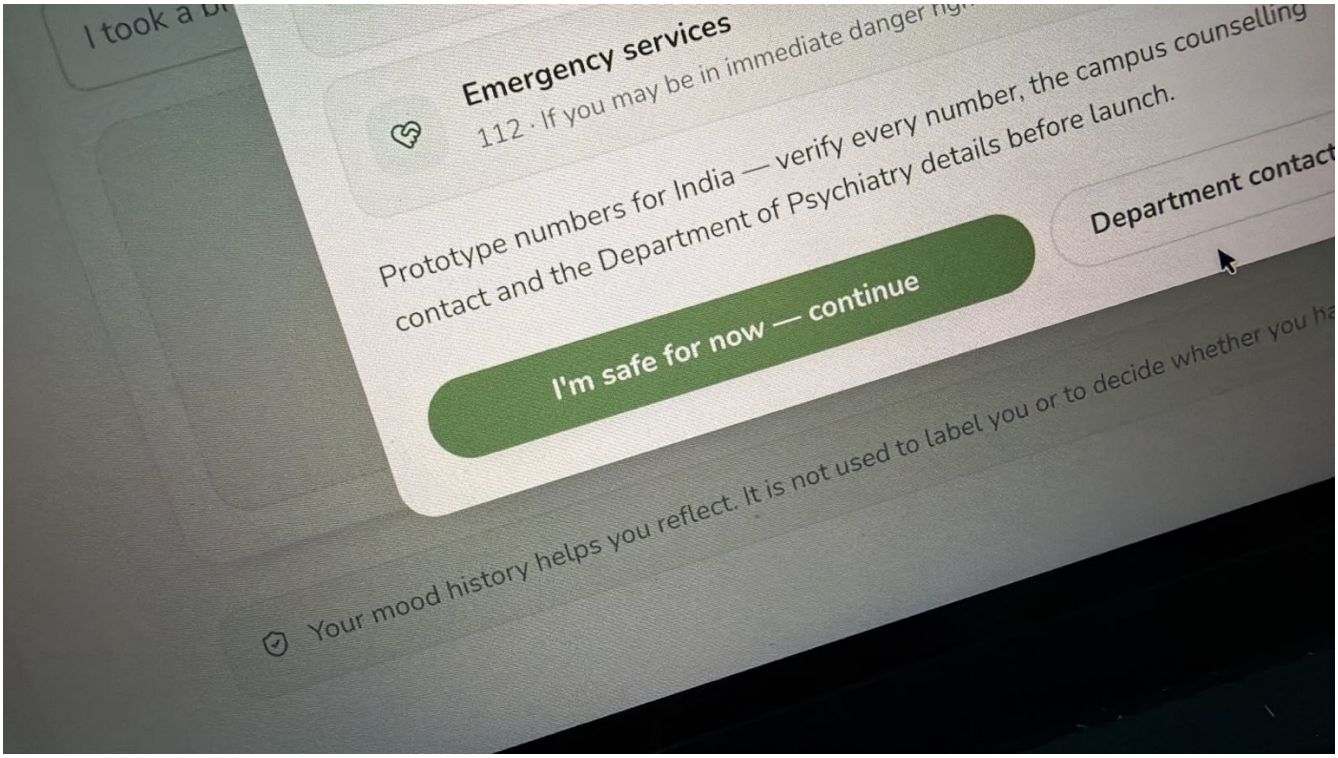

Issue / observation

The continue button/wording is specifically requested to be removed, and the Department contact button currently behaves like a dummy button.

Action to be taken

Remove the “I’m safe for now — continue” button and any equivalent “Continue to my space” text. Keep the dialog accessible and non-blocking. Wire Department contact to open the department contact page/modal; show a clear loading/error state if details cannot load.

Screenshot evidence

IC-05 — Department contact — profiles and appointment scheduling

Evidence from screenshot

The screenshot shows the Department contact button in the support dialog, but no working contact details are shown when it is clicked.

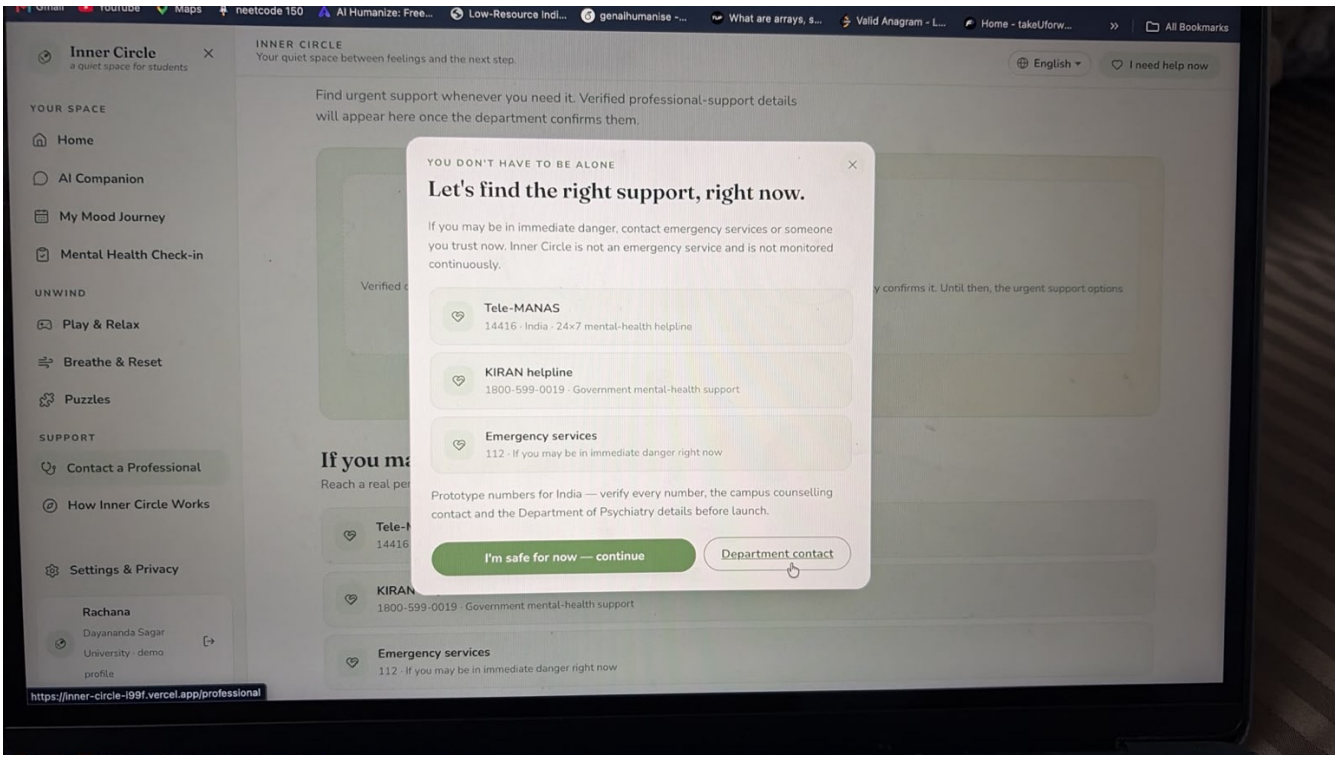

Issue / observation

The button has no meaningful response and does not let a student identify a contact or request an appointment.

Action to be taken

Make the button open a contact screen. Add fictional placeholder profiles such as “Dr. A. Example — Demo psychiatrist” with qualification, years of experience, areas of support and available appointment slots. Add a Schedule appointment form with date/time selection, reason (optional), confirmation and cancel/reschedule handling as appropriate. Mark every profile and booking as demo until the university supplies verified information; do not invent real staff credentials.

Screenshot evidence

IC-06 — Profile — editable details

Evidence from screenshot

The screenshot shows a “Your profile” section with “Read-only details from the demo profile stored on this device.”

Issue / observation

The user cannot edit profile details from the displayed page.

Action to be taken

Change the profile to an editable form for appropriate fields (for example, display name, email, age and university if these are intended to be user-editable). Add Edit, Save and Cancel controls, validate inputs, persist changes using the intended prototype storage, and show confirmation or error feedback. Do not expose sensitive data unnecessarily.
